TITLE : CUTTER AND RECORDER
THEREWITH

ABSTRACT : PURPOSE: To get rid of any fear of causing deformation such as a warp or the like in a cutting edge even if the edge and the guide member different in each thermal expansion coefficient are combined together by attaching the guide member, being partially locked by self-elastic force so as not to prevent its expansion or contraction due to dilatation or shrinkage, in the edge of a cutter.

CONSTITUTION: A guide member 5e is locked to a movable cutter 5b by elastic force of a presser piece 5e2 and fitting between a projection 5b2 and holes 5e4, 5e5. At this time, only when one spot in the central part of the guide member 5e is restrained so as not to move with the movable cutter 5b by the fitting between the hole 5e4 and the projection 5b2, both ends in the longitudinal direction of the guide member 5e becomes slidable with the movable cutter 5b. Accordingly, even if the guide member 5e and the movable cutter 5b are expanded or contracted by temperature change, the guide member 5e and the movable cutter 5b are expandable each other in the longitudinal direction, so that such a situation that the movable cutter 5b is warped and thereby disused as a cutter 5 will not happen.
